Assignment -1

Q1. Follow below steps and implement code in C for scanner.

<table>
<tr><td>Step 1</td><td>Generate text file for given Input</td></tr>
<tr><td>Step 2</td><td>Declare two static table for Operator and Keywords</td></tr>
<tr><td>Step 3</td><td>Declare two dynamic table for constant and Symbol</td></tr>
<tr><td>Step 4</td><td>Read Input file apply STRTOK () to tokenize given input string (get logic from Help menu)</td></tr>
<tr><td>Step 5</td><td>In tokenization While loop, for each token
Check for keywords from keyword table if it exists then print [KW#index], where index is the record number in the respective table.
Else Check for Operator from Operator table if it exists then print [OP#index], where index is the record number in the respective table.
Else check that given token is digit then check whether it exists in constant table then print [CO#index], where index is the record number in the respective table, else store digits in constant table then print [CO#index]
Else check that given token exists in symbol table then print [ID#index], where index is the record number in the respective table, else store symbol in symbol table then print [ID#index]</td></tr>
<tr><td>Ex:</td><td>INPUT :
INT a , b ;
REAL c , d ;
a = b + c * 100 ;
d = a – 90 ;

Static Table:
<table><tr><td>OP TABLE</td><td>,</td><td>;</td><td>=</td><td>*</td><td>+</td><td>-</td></tr></table>
<table><tr><td>KW TABLE</td><td>INT</td><td>REAL</td></tr></table>
Dynamic table:
<table><tr><td>ID TABLE</td><td>a</td><td>b</td><td>c</td><td>d</td></tr></table>
<table><tr><td>CO TABLE</td><td>100</td><td>90</td></tr></table>
OUTPUT :

[KW #1] [ID #1] [OP #1] [ID#2][OP#2]
[KW#2] [ID#3][OP#1][ID#4][OP#2]
[ID#1][OP#3][[ID#2][OP#5][ID#3][OP#4][CO#1][OP#2]
[ID#4][OP#3][ID#1][OP#6][CO#2][OP#2]</td></tr>
<tr><td></td><td></td></tr>
</table>

Q2. Follow below step and implement code in c for DFA.

<table>
<tr><td>Step 1</td><td>Declare STT for int, real and id</td></tr>
<tr><td>Step 2</td><td>Declare s_table[6][4][6]
<table>
<tr><td>State</td><td>d</td><td>l</td><td>.</td></tr>
<tr><td>Start</td><td>INT</td><td>ID</td><td>Error</td></tr>
<tr><td>INT</td><td>INT</td><td>Error</td><td>S</td></tr>
<tr><td>S</td><td>REAL</td><td>Error</td><td>Error</td></tr>
<tr><td>REAL</td><td>REAL</td><td>Error</td><td>Error</td></tr>
<tr><td>ID</td><td>ID</td><td>ID</td><td>Error</td></tr>
</table></td></tr>
<tr><td>Step 3</td><td>Take input; pre_state = ”start”</td></tr>
<tr><td>Step 4</td><td>Calculate length of input = len</td></tr>
<tr><td>Step 5</td><td>Int k=0; c=0; i=0;</td></tr>
<tr><td>Step 6</td><td>While (k<len)
{
for i=1 to 6{
compare pre_state with s_table[i][0] & decide row of s_table;
find out column “c” of the s_table by calling function for checking character is letter, digit or dot(.)
copy s_table[i][c] to cur_state;
break;
}
Copy pre_state = cur_state
K++;
}</td></tr>
<tr><td>Step 7</td><td>Print (pre_state, current character, cur_state)</td></tr>
<tr><td>Ex.</td><td>INPUT:
123

OUTPUT:

START 1 INT
INT 2 INT
INT 3 INT

Valid Integer</td></tr>
</table>

Exercise---

1) Implement DFA for INT.
2) Implement DFA for ID.

Q3. Implement RD parser for checking input string is valid or not and print parse tree in postorder.
